New Jersey's Violent Death Reporting System

A collaboration between the Center for Health Statistics at the New Jersey Department of Health and Senior Services and the Violence Institute @ UMDNJ

Purpose:

To implement a violent death surveillance system that combines data from multiple sources to develop a comprehensive understanding of all homicides and suicides. Use this information to develop prevention programs that will reduce the number of homicides and suicides.

Scope:

All homicides and suicides committed in New Jersey from January 1, 2003 forward.

An epidemiological approach to determine

- **▶** Who
- ▶ What
- Where
- ▶ When
- How violent deaths occur.

Data Sources:

- Death certificates
- Medical examiner reports
- ▶ Police records / reports
- Crime lab reports

The Center for Disease Control and Prevention hopes to build a National Violent Death Reporting System. New Jersey is one of six pilot states.

The other pilot states are:

- Maryland
- Massachusetts
- Oregon
- South Carolina
- Virginia

The New Jersey project:

- Will use standardized CDC data collection elements/software
- Will collect data quarterly
- Will have a Technical Advisory Board comprised of representatives of data providing agencies
- Will have a General Advisory Board to review, and hopefully use, project reports
- Will generate detailed homicide and suicide reports
- Will have a website for posting of project reports

The Center for Disease Control and Prevention's National Violent Death Reporting System is modeled after a pilot system implemented by the Harvard School of Public Health's Injury control Research Center.

The following jurisdictions participate in the Harvard pilot project:

- Connecticut
- Maine
- Utah

- San Francisco
- Pittsburgh area
- Miami-Dade County

What have we learned about suicide from the Harvard pilot project sites?

- ► There are informants for suicide cases who can provide useful information
- Incident narratives provide a rich array of contextual information
- ▶ 92% of suicide cases had at least one precipitating circumstance noted

Some preliminary findings from the Harvard pilot project's 2000 data on firearm suicides:

Victim Demographics

	#	%
Male	468	90
Female	53	10
0-19 Years	33	6
20-24	48	9
25-44	164	31
45-64	163	31
65+	111	21

Other findings:

- 29% (148) had previously disclosed suicidal ideations
- ▶ 11% (58) had previously attempted suicide
- 37% (154) tested positive for alcohol and/or drugs
- ► 17% (86) had a history of an alcohol or other substance abuse problem
- ► 52% (272) were depressed or had a history of depression or other mental

Precipitating factors (not mutually exclusive):

- ▶ 32% (167) A relationship problem
- ▶ 25% (131) A physical health problem
- ► 16% (81) A job or income problem
- 21% (107) Three or more precipitating factors

Did suicide follow a recent life crisis (e.g., arrest, job loss, relationship break-up, legal trouble, bad report card, etc.)?

- ▶ 20% (84) had a same day life crisis
- ➤ 31% (134) had a life crisis within the previous two weeks

The most frequently occurring same day or recent life crisis was a "criminal problem" (83%)

As victim age increases, the likelihood of a same day or recent crisis decreases

	_						_				L															٦						4		E		Ξ			L				Я	×		Ш		Ι.					-

11.		М			1		-			т.				7																																									

In addition to this difference between victims of differing ages, there were other differences between age groups and differences between males and females.

The Goal for New Jersey's Violent Death Reporting System:

Develop a detailed and comprehensive understanding of all homicides and suicides and use that understanding to develop effective prevention strategies.
